PLAIN MRI LEFT KNEE

EXAMINATION TECHNIQUE

- Multi-planar imaging done through knee joint acquiring T1WS weighted & STIR sequences in sagittal, coronal and axial planes.

FINDINGS

- Anterior cruciate ligament is thickened with internal linear fluid signal intensity areas seen on T2W FS images, suggestive of partial intrasubstance tear.
- Mild joint effusion is seen.
- No meniscal injury is seen.
- Posterior cruciate ligament appears normal.
- Both collateral ligaments are intact.
- Patellar tendon shows no tear / swelling.
- No evidence of any excessive free fluid in the joint cavity / supra-patellar bursa.

CONCLUSION

- Intrasubstance tear of anterior cruciate ligament
- Mild joint effusion
